

La determinazione della resistenza residua dei terreni: limiti connessi all'applicazione delle diverse metodologie di laboratorio

Determination of residual strength of soils: limitations connected to the application of different methods of laboratory

Raffaele Carbone, Clemente Marco Tucci

Geotest S.a.s. Laboratorio Geotecnico - Melfi (PZ)

As well known, the residual resistance

of the cohesive soils is an extremely interesting geotechnical parameter to

analyse the equilibrium conditions of the hillsides. It has a real importance in

evaluating the stability of the old landslides and the risk of progressive

In laboratory there are different methods of testing parameters of the cutting resistance in residual conditions and, in particular, the most used ones are: the instrument of Direct Shear (Casagrande box) with the motion

Abstract

and slopes.

Termini chiave:

Resistenza residua dei terreni coesivi, condizioni di equilibrio dei pendii, parametri di resistenza al taglio in condizioni residue, apparecchio di Taglio Diretto (Scatola di Casagrande) con inversione del moto, apparecchio di Taglio Torsionale su provino anulare, valori di resistenza residua partendo dalle caratteristiche di plasticità dei terreni analizzati

Residual strength of cohesive soils, equilibrium conditions of the slopes, shear strength parameters in residual conditions, direct shear with a direction reversal, torsional shear apparatus on annular specimen, residual soil plasticity characteristics

apparatus (box of Casagrande) strength values starting from the
